

Network/IT™ Advanced Edition Option Pack

Total Network Management™

Network/IT delivers a powerful centralized management solution for distributed networks that are delivering today's eBusiness solutions. Through policy-based management, Network/IT aligns service levels with business objectives to provide ongoing availability, optimal performance, and management of networks in a business context.

With the increasing trend for eBusiness, the network plays an increasingly vital role in today's business arena. The transformation of business to the electronic and digital age has brought performance and user experience to the forefront. Network management can make the difference between an eBusiness initiative being a success or failure. Effective network management requires a solution that treats your network as an integral part of your business. Network/IT Advanced Edition Option Pack offers extended functionality and manageability to today's business owners. Options include:

Network/IT™ Application Response Option

Application response time has become the critical measure of overall Quality of Service for network users. The Network/IT Application Response Option monitors the actual end-to-end response time for targeted applications across enterprise infrastructures. It precisely reflects the performance of the application as experienced by end users throughout the organization, even enabling performance management of applications not designed for such management.

Network/IT™ ATM Management Option

In today's dynamic and competitive inter-networked marketplace, businesses are increasingly dependent on ATM networks to carry various types of information, such as voice, video, and application-specific data, and require the means to manage such networks in the same manner as their LANs. The Network/IT ATM Management Option provides monitoring and administration for the entire ATM network, including hardware, software, services, and devices that provide connectivity, and individual ATM circuits.

Network/IT™ DECnet Manager Option

The Network/IT DECnet Manager Option provides comprehensive network management capabilities to improve DECnet network availability and performance, resulting in better service for end users and a higher return-on-investment for the enterprise.

Network/IT™ Frame Relay Option

The Network/IT Frame Relay Option provides monitoring and administration for the entire frame relay network. This includes hardware, software, services, and devices that provide connectivity — as well as individual frame relay circuits — from a user perspective rather than the network provider's perspective.

Network/IT™ Response Probe™ Option

As network usage increases, network response time has become a critical factor in overall Quality of Service. The Network/IT Response Probe Option automatically collects end-user response time and performance metrics for major network protocols, including TCP/IP, NetBIOS, IPX/SPX, and SNA. Working with Network/IT, the Response Probe Option helps managers ensure the availability and optimal performance of their networks improving delivery of applications and services to business users.

Network/IT™ SNA Manager Option

The Network/IT SNA Manager Option provides an easy-to-use graphical interface for viewing enterprise-wide information pertaining to SNA network subsystems. This option is a client/server application that integrates CA-NetSpy® on the MVS platform, with SNA Real World Interface™ and SNA Manager Problem Analysis components on Windows NT workstations. It also enables CA-NetSpy to feed performance and alert data to Network/IT.

Network/IT™ SuperPing Path Doctor™ Option

The increasing complexity of today's networks, and greater dependence on availability and optimal performance for efficient business communications and service delivery, highlights the need for powerful, yet easy-to-use diagnostic and troubleshooting tools. Network/IT's SuperPing Path Doctor Option enables quick and accurate network problem identification and resolution. It provides network administrators with a view of how network traffic is flowing by visually representing the paths between any two points on the network and simulation of real-world application traffic. Network/IT's SuperPing Path Doctor is the proven solution for the effective and efficient monitoring of the networked enterprise.

Network/IT™ Switch Management Option

The Network/IT Switch Management Option enables network administrators to discover, monitor, and manage their switched environments in the same consistent manner as the rest of the IT infrastructure, helping them achieve Total Network Management.

Network/IT™ System Management Option

The Network/IT System Management Option and system agents enable system administrators to control their environment by monitoring status, event, and configuration information for critical operating system parameters. These system agents also monitor key desktop and server operating system resources for adherence to user-defined policy. They detect deviations from profiles and, if necessary, escalate events to Network/IT for appropriate action.

Supported Platforms

- Various UNIX Platforms
- Linux
- Windows NT
- Windows 95, 98
- NetWare
